3. Summarize an Article into 50 Words

Aim:

To design zero-shot, one-shot, and few-shot prompts for summarizing an article in 50 words and compare the summaries based on accuracy, completeness, and readability.

Procedure:

1. Select an article.
2. Create three prompts using zero-shot, one-shot, and few-shot methods.
3. Generate a 50-word summary for each prompt.
4. Compare the summaries based on accuracy, completeness, and readability.

Sample Article:

Artificial Intelligence is transforming education through personalized learning, virtual tutors, and automated grading. AI tools analyze student performance and recommend suitable learning materials. These systems help teachers save time and support students. However, privacy concerns, unequal access to technology, and overdependence on automated systems remain important challenges.

Prompt:

Zero-shot:

Summarize the following article in exactly 50 words. Include the main idea, benefits, and challenges.

[Paste the article here.]

One-shot:

Example:
Article: Online learning provides flexible education but requires reliable internet access.

Summary: Online learning offers flexible education, but limited internet access can prevent some students from participating.

Now summarize the given article in exactly 50 words using a similar style.

[Paste the article here.]

Few-shot:

Example 1:
Article: AI supports early disease detection but depends on reliable data.

Summary: AI helps detect diseases early, although its reliability depends on data quality.

Example 2:
Article: Online learning improves flexibility but internet inequality limits participation.

Summary: Online learning offers flexible access, while unequal internet access restricts participation.

Now summarize the given article in exactly 50 words. Include the main idea, benefits, and challenges.

[Paste the article here.]

Output:

- Zero-shot: Artificial Intelligence is transforming education through personalized learning, virtual tutors, and automated grading. These tools analyze student performance, recommend learning materials, and save teachers time. However, privacy concerns, unequal access to technology, and excessive dependence on automated systems remain challenges that require responsible implementation.
- One-shot: Artificial Intelligence improves education through personalized learning, virtual tutoring, and automated grading. It helps teachers save time and supports students with suitable learning materials. However, privacy concerns, unequal technology access, and dependence on automated systems remain challenges that educational institutions must address.
- Few-shot: Artificial Intelligence supports education through personalized learning, virtual tutors, and automated grading. It helps analyze student performance, recommend learning materials, and reduce teachers' workload. However, data privacy, unequal technology access, and overdependence on automated systems remain concerns that require responsible and balanced implementation.

Comparison:

Criteria	**Zero-shot**	**One-shot**	**Few-shot**
Accuracy	Covers the main ideas	Follows the example	Encourages balanced coverage
Completeness	Includes benefits and challenges	Includes major points	Includes benefits and concerns
Readability	Clear	Simple and concise	Structured and balanced

Result: All three techniques can summarize an article. One-shot helps maintain a demonstrated style, while few-shot encourages consistency. Actual accuracy must be verified against the original article.
